

Face Recognition for Digifort

SAFR® for Digifort is an AI layer on top of your VMS, providing enhanced situational awareness without the need for additional hardware or personnel. Face recognition is a force multiplier. SAFR matches faces appearing on live video feeds against watchlist images more effectively, and with less bias, than humans – freeing up security personnel to manage emerging incidents in real time and giving them the information they need to respond to persons of interest more quickly. SAFR is 99.87% accurate, provides 24/7 vigilance, and has live video match speeds under 100 milliseconds. Transform video feeds into streams of actionable data with SAFR – the best-performing face recognition for live video.

Key Features

Global Events

Custom alarms instantly notify security personnel when persons of interest enter or leave a monitored area. Easily configure a variety of automated responses to detection and recognition events.

Digifort VMS alarm activated by SAFR face recognition

Automatic Bookmarks

Bookmarks containing rich, searchable metadata allow for more-efficient post-event investigation and compliance reporting, and help defend against frivolous lawsuits.

Digifort VMS bookmarks automatically generated with SAFR face recognition

Live Analytics

Actionable, AI-gathered data that you'll actually use – view traffic volumes, demographics, dwell times, and more.

SAFR is compatible with
Digifort VMS Version 7.2.1
